I encountered compile errors when running TIEGCM after I set the option SEE_NCFIL= '\$TGCMData/see__L3_merged_2015098_011.ncdf', which is downloaded from ftp://laspftp.colorado.edu/pub/SEE_Data/level3/. However, if I commented out the see_ncfile, just running with GPI_NCFIL, then all things goes fine.

Did I import the correct see_ncfile? Where could I download suitable see_ncfile? Or is there any format problem in my input files(in attachments)?

I noticed that in the .out file of TIEGCM running, many '^@' appears as:
'Title: SEE Level 3 Time Series Data Product - merged daily XPS and EGS data^@
Source: SEE POC at LASP / CU^@
Mission: TIMED^@',
and model shutdown with
'>>> rd_soldata: nwaveflux /= nwave: nwaveflux= 195 nwave=*****
Shutdown: stop message: rd_soldata
Shutdown calling mpi_abort..'
what problem does these lines imply?

Thank you very much!

Make sure \$TGCMData points to the location of the SEE data file. If this is not the problem, please send me the compile error.
